DomesticLeadForm.js
JavaScript

domestic_leads_model.js
JavaScript

I want to add the automatic incremental sl no in the view table section's table One column in this table must be serial number

Got it — this is a **very clean requirement** and your current code already supports it easily 👍

You already have:

- Data coming from DB (`id` exists and auto-incremented) domestic_leads_model
- Table rendering using `.map()` in **ViewDomesticLeadsData** DomesticLeadForm

Now we'll add a **Serial Number (Sl No)** column in the frontend.

✅ ✅ BEST APPROACH (Frontend Serial Number)

👉 No backend change needed
👉 Works with filters, search, sorting
👉 Automatically updates

🔥 STEP-BY-STEP IMPLEMENTATION

✅ 1. Add column in Table Header

Go to **TableHead → TableRow**

Add this **before Actions column OR after (your choice)**

JavaScript

```javascript
<TableCell
  align="center"
  sx={{
    ...headerCellStyle,
    minWidth: 60,
  }}
```

```
>
  Sl No
</TableCell>
```

✅ 2. Add Serial Number in Table Body

Find this part:

```javascript
filteredSortedData.map((row) => (
```

👉 Replace it with:

```javascript
filteredSortedData.map((row, index) => (
```

Now add this column inside `<TableRow>`

👉 Add BEFORE Actions column:

```javascript
<TableCell align="center" sx={{ fontWeight: 600 }}>
  {index + 1}
</TableCell>
```

✅ FINAL STRUCTURE (IMPORTANT)

🔹 TableHead

```javascript
<TableRow>
  <TableCell align="center">Sl No</TableCell>
  <TableCell align="center">Actions</TableCell>
  ...
</TableRow>
```

🔹 TableBody

```javascript
filteredSortedData.map((row, index) => (
  <TableRow key={row.id}>

    {/* SERIAL NUMBER */}
    <TableCell align="center">
      {index + 1}
    </TableCell>

    {/* ACTIONS */}
    <TableCell align="center">
      ...
    </TableCell>

    {/* OTHER COLUMNS */}
  </TableRow>
))
```

🎯 RESULT

You will get:

Sl No	Actions	Tender Name	Customer	...
1	✏️ 🗑️	ABC Tender	XYZ	
2	✏️ 🗑️	DEF Tender	PQR	

🚀 IMPORTANT BEHAVIOR

✔️ Auto updates when:

- New data added
- Search applied
- Filters applied
- Sorting changes

✔️ Always sequential (1,2,3...)

⚡ BONUS (Optional Advanced)

If you want **global serial number (DB-based)** instead:

JavaScript

```javascript
<TableCell align="center">
  {row.id}
</TableCell>
```

👉 Uses backend auto-increment ID

🧠 RECOMMENDATION

Use this:

👉 `index + 1` (BEST for UI tables)

Because:

- Clean
- Dynamic
- Matches filtered results

💥 If you want next upgrade:

I can add:

🔥 Pagination with serial number continuity
🔥 "Showing 1–10 of 120 entries" counter
🔥 Row count badge in search bar
🔥 Export with serial number

Just tell me 👍

Sources

regenerate the ready to run code with changes for me

Perfect — I'll give you **ready-to-run updated code** for your table section only (no unnecessary changes, fully compatible with your existing file).

✅ 🔥 FINAL UPDATED CODE (WITH SERIAL NUMBER)

👉 Replace your TableHead + TableBody with this

JavaScript

```javascript
<Table stickyHeader size="small">
  <TableHead>
    <TableRow>
      {/* ✅ SERIAL NUMBER COLUMN */}
      <TableCell
        align="center"
        sx={{
          ...headerCellStyle,
          minWidth: 60,
        }}
      >
        Sl No
      </TableCell>

      {/* ACTION COLUMN */}
      <TableCell
        align="center"
        sx={{
          ...headerCellStyle,
          minWidth: 140,
        }}
      >
        Actions
      </TableCell>

      {/* DYNAMIC COLUMNS */}
      {leadColumns.map((col) =>
        visibleColumns[col.id] ? (
          <TableCell key={col.id} sx={headerCellStyle}>
            {col.label}
          </TableCell>
        ) : null
      )}
    </TableRow>
  </TableHead>

  <TableBody>
    {filteredSortedData && filteredSortedData.length > 0 ? (
      filteredSortedData.map((row, index) => (
```

```
          <TableRow
            key={row.id}
            hover
            selected={selectedRow?.id === row.id}
            onClick={() => handleRowSelect(row)}
            onDoubleClick={() => handleRowDoubleClick(row)}
          >
            {/* ✅ SERIAL NUMBER VALUE */}
            <TableCell align="center" sx={{ fontWeight: 600 }}>
              {index + 1}
            </TableCell>

            {/* ACTIONS */}
            <TableCell align="center">
              <Stack direction="row" spacing={1} justifyContent="center">
                <IconButton
                  size="small"
                  onClick={(e) => {
                    e.stopPropagation();
                    handleEditClick(row);
                  }}
                >
                  <EditRounded fontSize="small" />
                </IconButton>

                <IconButton
                  size="small"
                  onClick={(e) => {
                    e.stopPropagation();
                    handleDeleteClick(row.id);
                  }}
                >
                  <DeleteRounded fontSize="small" />
                </IconButton>
              </Stack>
            </TableCell>

            {/* OTHER COLUMNS */}
            {leadColumns.map((col) => {
              if (!visibleColumns[col.id]) return null;

              return (
                <TableCell key={col.id}>
                  {row[col.id]}
                </TableCell>
              );
            })}
          </TableRow>
        ))
      ) : (
        <TableRow>
          <TableCell
```

```
            colSpan={
              leadColumns.filter((c) => visibleColumns[c.id]).length + 2
            }
            align="center"
          >
            No data found
          </TableCell>
        </TableRow>
      )}
    </TableBody>
  </Table>
```

✅ WHAT YOU JUST GOT

✔ Serial number column added
✔ Automatically increments
✔ Works with:

- Search
- Filters
- Sorting
- Delete / Edit

✔ No backend change needed (your DB already has `id`) domestic_leads_model

---

💡 SMALL BUT IMPORTANT FIX

Notice this line:

```javascript
+ 2
```

👉 Because:

- 1 = Serial Number column
- 1 = Actions column

🚀 RESULT

Your table now looks like:

Sl No	Actions	Tender Name	Customer	...
1	✏️ 🗑️	ABC	XYZ	
2	✏️ 🗑️	DEF	PQR	

⚡ NEXT UPGRADE (Highly Recommended)

If you want, I can enhance it further:

🔥 Serial number across pagination (1–1000 continuity)
🔥 Row count display ("Showing 25 of 300")
🔥 Sticky serial column
🔥 Excel export with Sl No

Just tell me 👍
